

Order	Function/Concept	Definition
-------	------------------	------------

1	import pandas as pd	Imports the pandas library.
2	Series()	Creates a one-dimensional labeled array.
3	DataFrame()	Creates a two-dimensional table.
4	read_csv()	Reads data from a CSV file.
5	read_excel()	Reads an Excel file.
6	read_json()	Reads a JSON file.
7	to_csv()	Saves a DataFrame as a CSV file.
8	to_excel()	Saves a DataFrame as an Excel file.
9	head()	Displays the first n rows.
10	tail()	Displays the last n rows.
11	sample()	Returns random rows from the DataFrame.
12	shape	Returns the number of rows and columns.
13	columns	Returns column names.
14	index	Returns row labels (index).
15	dtypes	Shows the data type of each column.
16	info()	Displays dataset information.
17	describe()	Generates summary statistics.

Data Selection

Order	Function	Definition
18	[]	Select one or more columns.
19	loc[]	Select rows/columns using labels.
20	iloc[]	Select rows/columns using positions.
21	Boolean Indexing	Filter rows based on conditions.

Sorting & Indexing

Order	Function	Definition
-------	----------	------------

23	sort_values()	Sort by column values.
----	---------------	------------------------

24	sort_index()	Sort by index labels.
----	--------------	-----------------------

Missing Data

Order	Function	Definition
-------	----------	------------

27	isnull() / isna()	Detect missing values.
----	-------------------	------------------------

28	notnull() / notna()	Detect non-missing values.
----	---------------------	----------------------------

29	dropna()	Remove missing values.
----	----------	------------------------

30	fillna()	Fill missing values.
----	----------	----------------------

31	replace()	Replace specified values.
----	-----------	---------------------------

Data Cleaning

Order	Function	Definition
-------	----------	------------

32	drop()	Remove rows or columns.
----	--------	-------------------------

33	rename()	Rename columns or index labels.
----	----------	---------------------------------

34	astype()	Change a column's data type.
----	----------	------------------------------

35	duplicated()	Find duplicate rows.
----	--------------	----------------------

36	drop_duplicates()	Remove duplicate rows.
----	-------------------	------------------------

Column Operations

Order	Function	Definition
-------	----------	------------

37	Add a column	Create a new column with df["new"] =
----	--------------	---

38	insert()	Insert a column at a specific position.
----	----------	---

39	pop()	Remove and return a column.
----	-------	-----------------------------

Order	Function	Definition
-------	----------	------------

Statistics

Order	Function	Definition
41	mean()	Calculate the average.
42	median()	Calculate the middle value.
43	mode()	Find the most frequent value.
44	sum()	Calculate the total.
45	count()	Count non-missing values.
46	min()	Find the minimum value.
47	max()	Find the maximum value.
48	std()	Calculate the standard deviation.
49	var()	Calculate the variance.
50	value_counts()	Count unique values.
51	unique()	Return unique values.
52	nunique()	Count distinct values.

String Operations

Order	Function	Definition
53	str.upper()	Convert text to uppercase.
54	str.lower()	Convert text to lowercase.
55	str.title()	Convert to title case.
56	str.contains()	Check for a substring.
57	str.replace()	Replace text.
58	str.split()	Split strings into lists.
59	str.strip()	Remove leading/trailing whitespace.

Order	Function	Definition
80	<code>plot()</code>	Create basic plots.
81	<code>plot.bar()</code>	Create a bar chart.
82	<code>plot.hist()</code>	Create a histogram.
83	<code>plot.box()</code>	Create a box plot.
84	<code>plot.scatter()</code>	Create a scatter plot.
